

REBUILDS

Your Flutter app drops frames
redrawing things that never
changed.

It feels fine on your
phone. Not on theirs.

- Scroll stutters on mid-range Android
- Battery drains on simple lists
- Widgets rebuilding hundreds of times

The Rebuild Audit — three passes, one afternoon.

You are not optimising code. You are
finding what redraws for no reason.

O I

Turn on the counter

DevTools shows you exactly which widgets redraw, and how often.

O 2

Const the static

Any widget that never changes
should never be rebuilt.

03

Shrink the scope

Push setState down to the smallest widget that owns the state.

16ms

the entire budget for one frame at 60fps — every needless rebuild spends part of it

- ✓ Stutter you can actually locate
 - ✓ No refactor, no new packages
 - ✓ Works on the phones users own
-

Building mobile for a startup?
